

# LegalEase: AI-Powered Legal Document Generator

## Phase 5 – Project Development

**Prepared by:** M. Poornima

**Class:** II BCA

**Institution:** S.S.K.V College of Arts and Science for Women

**Date:** 24.09.2026

**Prepared for:** Dr. V. Priya

### Phase Overview

This phase implements the LegalEase modules and integrates them into a usable application.

### Development Environment

A suitable implementation may use HTML/CSS/JavaScript or React for the frontend, a backend such as Python or Node.js, a database where needed, and an AI model/API for assisted generation.

### Development Sequence

- Build the interface and navigation.
- Implement document categories and forms.
- Add field validation.
- Implement templates and AI-assisted generation.
- Add preview and editing.
- Add PDF/DOCX export.
- Add saving/history if included.
- Integrate and refine all modules.

### AI-Assisted Generation Process

The user selects a document category and enters structured facts. The system validates the information, applies document-specific rules, and generates a draft using controlled instructions. The draft is then displayed for human review and editing.

### AI Safety and Quality Controls

- Do not invent user facts.
- Use explicit document type and field constraints.
- Separate user facts from generated wording.
- Display a draft/review notice.
- Allow users to edit before export.

- Where feasible, preserve source inputs for traceability.

## Document Output

The system can support PDF for presentation/printing and DOCX for further editing, depending on the final implementation.

## Development Result

The expected prototype workflow is: select document → enter information → generate draft → review/edit → preview → export.

**Academic Project Note:** LegalEase is an educational drafting prototype. AI-generated legal text should be treated as a draft and reviewed by a qualified legal professional before real-world legal use.
